History of Development and Testing for **Sure-Board® Series 200B Ballistic**

May 2006 UL 752 Ballistic Article

Article in LGSEA monthly publication explaining the value of Sure-Board® to resist the penetration of ballistic projectiles and how it will make the construction of the typical safe room or secure facility easy and economical to build. We have now developed a Kevlar bag approach that is very easy to use. This same Kevlar bag can increase your normal UL752 Level 3 to a Level 8 with just a dry granular fill included.

Today February 18, 2010 Finalized UL752 Testing and Passed Level 3/8

The research and development department of Intermat and Cemco have been performing ongoing UL 752 approved Ballistic Testing. As of February 18, 2010 we have successfully completed the required test programs required to qualify under UL 752 Standards Level 3 and Level 8 Protection. We are also planning to develop more specialized energy dissipating hardware to include into your standard construction project soon. The current products and methods are adequate for now, but we believe, at Intermat and Cemco, that we can develop an even better blast protection system for your needs very soon. Let Sure-Board® be your choice Today.
